Fighting against Coronavirus (COVID-19)

Coronavirus Disease 2019 (COVID-19) is a new coronavirus not previously found in humans. There are seven types of coronavirus' that cause upper respiratory symptoms. COVID-19 is the most recent coronavirus disease to be discovered. Other recent examples of coronavirus disease are SARS-CoV and MERS-CoV. The new coronavirus originated in Wuhan City, Hubei Province, China. The first case was recorded in December 2019.

In march 8, Bangladesh confirm first three case of coronavirus. Bangladesh recently face many diseases like as dengue, chikungunya, Nipah-virus etc. In Bangladesh population density is high for this reason any type of disease can spreading high risks. The virus spreads from person to person by droplets in the air when an infected person coughs or sneezes. It can also spread on surfaces. The CDC recognizes that since COVID-19 is a new disease, they are still learning how it spreads.

It's time to aware and careful about COVID-19.

Suggestions:

1. Enough corona virus test kids and enough number of thermal scanner for test corona virus whose are comes from another country. Need to full information and emergency proper treatment whose test are positive.

2. Need a government instruction based committee about COVID-19. The committee member are collect data about the number of infected person and notify the government committee about current situation in everywhere of Bangladesh. The committee member is in all 64 district so that they can collect data properly and make awareness between peoples.

3. We need the infected people last 1-month data for the infected person are where go and all person data who are communicate the infected person. With the help of proper data, we can identify the infected people and give the emergency treatment for the virus can't spread as pestilence.

4. Infected person need to be careful because the virus spreads from one person to another person by droplets in the air. So that it's better that without any urgent necessary infected people no need go nearby place.

5. Who are recently meet with the infected person and those persons are where to go and meet with which peoples, need to collect all data. If any person are common symptoms of corona virus such that fever, cold, Cough, Shortness of breath etc. urgent need to test corona. So that he/she should be confirm.

6. With proper data we know which area are danger and it can stop the spread of the corona virus. After collect the symptoms we advise first of all test of corona and gives advise don't afraid need to be careful and awareness about corona virus.
